

Smart data management for *AutoCAD Civil 3D* pipe networks

Urbano Visio is a pipe network data management add-in for *AutoCAD Civil 3D*, with smart features for pipe and structure selection, editing and analysis. It supports a modern BIM workflow, improves productivity and decreases design time.

Civil engineers and experts contributed their ideas and experience to help create a software that offers solutions to real-life problems. **Urbano Visio** is the right tool to help you find and inspect important design data, use smart data selections and filters, apply editing changes with precision and quickly create data tables and reports.

Urbano Visio is available for *AutoCAD Civil 3D* 2016 – 2017.

KEY FEATURES

DATA GRID

Display all pipe and structure data including custom data from a part list, expressions and *AutoCAD Map 3D* object data. Create custom data groups and store them in configurations for use in new projects.

SELECTIONS

Select pipes and structures directly from the drawing and view their data in the data grid. Smart selections include element sequence, network branch and profile.

FILTERS

Create simple and complex data queries to serve as ready-to-use filters for the data grid. Apply filters to display only pipes/structures that match the selected query conditions.

INSPECTION

Select any cell in the data grid and the appropriate pipe or structure will be highlighted in both plan and profile views. Then zoom-in to plan or profile for an up-close inspection.

EDITING

Select one cell, several cells or a whole column and set the new value. Use smart selections and editing to quickly input missing data and correct mistakes.

TABLES

Select any part of the data grid and create a standard *AutoCAD* table with *AutoCAD Civil 3D* data for pipes and structures. After you make design changes, the table will refresh automatically.

REPORTS

To create a simple report just copy any part of the data grid and paste it directly to another *Windows* program e.g. *Microsoft Excel*. Reports can contain standard and custom data for pipes and structures, expressions and object data.

LEARN QUICKLY

Every program function is documented in the online help and supported with video guides.
