Analyze, Delete or Merge Non-standard Revit Styles

Ideate StyleManager addresses the challenges that arise when Revit users load or import content into the model, because the corresponding non-standard styles automatically come with the content. Proper management of these styles reduces publishing errors and end-user confusion, but the management process in Revit can be time consuming and risky. Errors can dramatically impact the models and production documents so effective management is critical. Ideate StyleManager allows you to accomplish the following tasks.

Safely delete styles that otherwise cannot be deleted or purged in Revit software and merge non-standard styles into standard styles

Clean Up Object Styles, Line Styles, Line Patterns, Fill Patterns, View Filters, View Templates, Scope Boxes, Materials, and Material Appearance Assets

Forensically analyze the usage of all styles to understand the true scope of a deletion

Understand which view filters are applied to any specific view
